WAVE REPORT

The Forrester Wave™: AI Foundation Models For Language, Q2 2024

The 10 Providers That Matter Most And How They Stack Up

June 5, 2024

By Rowan Curran, Mike Gualtieri with Srividya Sridharan, Caroline Provost, Jen Barton

FORRESTER®

Summary

In our 21-criterion evaluation of AI foundation models for language providers, we identified the most significant ones and researched, analyzed, and scored them. This report shows how each provider measures up and helps enterprise business and technology professionals select the right one for their needs.

Additional resources are available in the online version of this report.

Benchmarks Are Only One Chapter In The AI Foundation Model Story

The genAI zeitgeist propelled AI foundation models for language (AI-FMLs) to the forefront of technology and business leaders' minds. These leaders are exhilarated by the opportunity to augment employee knowledge, plug genAI into existing automation processes, and implement entirely new, transformative use cases. However, the market for AI foundation models can be one of the most inscrutable markets for buyers due to the absurd rate of innovation and the choices between hot startups and tech giants. Compounding the complexity of choosing a model is that enterprises are likely to need multiple models to satisfy specific use cases, including choosing from a vibrant market of open-weight model communities.

Enterprise business and technology leaders should not get unduly distracted by incremental improvements to benchmarks for AI-FMLs that seem to dominate AI news cycles. While a well-performing model is important to a successful use case, enterprise buyers must look beyond model myopia and look for AI-FML providers that:

- **Have a clearly articulated roadmap fine-tuned to enterprise needs.** Most AI-FML investment has focused on core model performance and tasks and has only recently shifted to the tooling needed to use these models effectively within an enterprise. Both are important to build enterprise AI applications. Core model capabilities for language extend also to understanding audio and images in the context of language. Larger context windows (how much data can be passed in a prompt) will obviate the need in some cases for retrieval augmented generation (RAG). Tooling for development, governance, and deployment will get more mature so enterprises can create and maintain a multitude of AI applications. Enterprises should intently inquire about a provider's roadmap to understand where it will invest and if that aligns with enterprise needs.
- **Can configure and govern models to reduce hallucinations and align with your brand.** AI-FMLs are powerful in a generalized way, but in order to provide value, they need to be aligned to business data, company values, and policies to diminish hallucinations and stay on brand. It's simple for an enterprise developer to pass a prompt to a model API and get the output back. That's the ungoverned (some may say "irresponsible") approach to building AI solutions. The responsible approach to developing AI solutions must include tools that AI development teams can use to manage and govern how the model is used within applications. Enterprises should look for AI-FML vendors that offer and/or integrate with third-party tools to configure model behavior, engineer/test prompts, audit activity,

© 2024 Forrester Research, Inc. All trademarks are property of their respective owners.
For more information, see the Citation Policy, contact citations@forrester.com, or call +1 866-367-7378.

manage model access, and control solution deployment.

- **Respect IP rights and the IP rights of others.** Enterprises are rightly concerned about protecting their data, including IP, customer data, and operational data. Enterprises expect that when they send prompts with company data that the AI-FML vendor won't use that data to improve the model or for any other use. They also expect transparency of the model's training data, so they don't inadvertently generate output that is at risk of violating data owners' IP rights. For use cases that don't combine company data, less transparency of the training data may be acceptable. However, for use cases that will use company data, enterprises should get contractual assurances that the vendor won't use the company data without permission or, better yet, indemnification from the misuse of first- and/or third-party data.
- **Can scale with low latency and never go down.** AI-FMLs are not immune to the laws of physics. The bigger the model, the more cycles it needs to return the output. Users of AI-FML chatbots are all too familiar with jittery output often taking several seconds to return a result. This might be acceptable for some human-model interaction use cases, but for automated uses, such as generating real-time custom product descriptions for an e-commerce application, a few seconds is unacceptable. Once AI-FMLs become part of an enterprise application, the expectation is that the model will always be accessible, just like other enterprise software. Enterprises should understand how AI-FML vendors use AI infrastructure (where models run) to minimize latency (model response time), maximize fault-tolerance (uptime), and elastically scale to handle spikes in usage.

Evaluation Summary

The Forrester Wave™ evaluation highlights Leaders, Strong Performers, Contenders, and Challengers. It's an assessment of the top vendors in the market; it doesn't represent the entire vendor landscape. You'll find more information about this market in our reports on AI foundation models for language.

We intend this evaluation to be a starting point only and encourage clients to view product evaluations and adapt criteria weightings using the Excel-based vendor comparison tool (see Figures 1 and 2). Click the link at the beginning of this report on Forrester.com to download the tool.

Vendor Profiles

Our analysis uncovered the following strengths and weaknesses of individual vendors.

Leaders

- **Google's Gemini combines a world-class model with enterprise cloud services.** Google's flagship model, Gemini, came out of its Google DeepMind research division, focused on cutting-edge AI models and research. Gemini is uniquely differentiated in the market, especially in multimodality and context length, while also ensuring interconnectivity with the broader ecosystem of complementary cloud services. Google has everything it takes to lead the AI market — enormous AI infrastructure capacity, a very deep bench of AI researchers, and a growing number of enterprise customers in Google Cloud. Google can become even more attractive to customers if it articulates a broader, transformative AI vision to enterprises versus highlighting single use cases.

  Google has strong capabilities across governance and security, model

© 2024 Forrester Research, Inc. All trademarks are property of their respective owners.
For more information, see the Citation Policy, contact citations@forrester.com, or call +1 866-367-7378.

management, and resilience and scalability. Gemini has the largest context window of all vendors evaluated: one million tokens today and two million tokens just announced. It's also one of the few commercially available multimodal large language models (LLMs), with substantial multilingual capabilities across 37 languages, higher than any other provider. Reference customers appreciate Google's long-term leadership in AI research and Google Cloud's complementary services. Google is a good fit for customers that have already standardized on Google Cloud or for enterprises that want to leverage a top-performing model that also includes mature tooling.

- **Databricks wants to bring model pretraining and fine-tuning, not just use, to the masses.** With the acquisition of MosaicML, Databricks takes a distinct approach to AI-FML, offering both its own pretrained model, DBRX, and support for clients pretraining or fine-tuning their own models. This strategy will set it up well to capture a small but growing sector of the AI-FML market, where differentiation will come from smaller and more domain-specific models. Databricks has a comprehensive feature-focused vision and roadmap but needs to do more to help typical enterprises innovate and implement AI-FMLs within their applications.

  Databricks' platform has strong capabilities in application development, governance, and security, and in managing models for training and deployment. It can improve the model by bringing multilingual capabilities up to par and adding multimodality and more transparency to its data for training the model. Reference customers appreciate that DBRX is open weight and nicely integrated with Databricks' Data Intelligence Platform. Databricks' offering is a good choice for enterprise customers who want a capable model that includes enterprise tooling to not only build solutions and fine-tune models, but also to pretrain their own model with their own data.

- **NVIDIA powers partners with AI infrastructure and offers models too.** NVIDIA offers AI infrastructure (hardware) that companies across the world rely on to train and use AI models. More recently, NVIDIA also released its own family of models, Nemotron, which is formidable in its own right. Nemotron allows NVIDIA's direct enterprise customers to use an NVIDIA model out of the box and inspires existing and new technology partners to push the frontier. If NVIDIA wants to compete more for enterprise customers, it needs to establish a roadmap that includes more enterprise tooling and to articulate a vision of enterprise transformation rather than technical prowess.

  NVIDIA's offering has very strong multilingual capabilities and offers multimodal

© 2024 Forrester Research, Inc. All trademarks are property of their respective owners.
For more information, see the Citation Policy, contact citations@forrester.com, or call +1 866-367-7378.

interactivity through its Megatron model. It also provides a robust set of filters and curation layers that can be applied to the data to produce high-quality training data to increase model performance. Its NeMo Framework allows it, and other AI-FML providers, to build AI-FML models more quickly and efficiently on its platform. Reference customers did not respond to Forrester's outreach for this evaluation. NVIDIA is a good fit for enterprises that want to work with a partner who can deliver the optimal bridge between hardware and software needs for training and inferencing models.

Strong Performers

- **IBM's Granite models are built for business but need to prove themselves in the market.** IBM had an AI head start years ago — remember Watson winning Jeopardy? The company's iconic research labs have been busy with AI since, and with the launch of IBM's Granite models within IBM's genAI watsonx platform, the company continues to deliver on its promise of building advanced AI capabilities. Enterprise customers not only get a good model that includes indemnification clauses; they also get some of the best enterprise tooling designed specifically for developing highly governable AI solutions. IBM is well positioned to entice its existing customers to take a deeper look at its AI solution, but it has to take its "built for business" vision to the next level to outmaneuver the competition.

  The Granite family of models provides enterprise users with some of the most robust and transparent insights into the underlying training data, important for efficiently refining model behavior for specific use cases and domains, and for protecting enterprises from risk from any unlicensed content in the training data. IBM's offering has significant and powerful capabilities to align its models to enterprise needs and the governance structures to enable the monitoring and management of models. IBM is lacking in context window, multimodal capabilities, and some core model capabilities, but we expect the next iteration of IBM models to take a leap forward. Reference customers appreciate IBM's emphasis on trusted AI, implementation services, and the sophisticated tools within watsonx to build AI solutions. IBM is a good fit for customers that want 100% vendor indemnification from model training data and AI platform capabilities that empower AI teams to build AI solutions.

- **OpenAI launched the genAI zeitgeist but must invest in more enterprise tooling.** OpenAI's mission and vision is to develop artificial general intelligence (AGI) for the good of humanity, full stop. This grand vision makes OpenAI the world's AI thought leader; however, OpenAI's competitive landscape is much broader and

© 2024 Forrester Research, Inc. All trademarks are property of their respective owners.
For more information, see the Citation Policy, contact citations@forrester.com, or call +1 866-367-7378.

more complex than two years ago, when its claim to fame was ChatGPT. While the company has a very strong research team and has introduced powerful models to the market thus far, the ever-widening landscape of commercial and open-source competition will present a challenge in the long run. The company's strategy of delivering premium models will keep it in the vanguard of AI, but great models aren't enough. Enterprise customers also need premium tooling to build and scale applications.

OpenAI's models are some of the most capable in the market, and it's one of the few providers offering multimodal LLMs. OpenAI's strengths are in its core model capabilities, including code generation, multilingual capabilities, context window, and the scope of its training data. It has a lot to do in developing tooling and support for enterprise developers who want to work with the models within OpenAI's platform. It also must improve its capabilities for enterprise application development, model management, and latency. Reference customers appreciate OpenAI's swift innovation and the availability of GPT-4 directly from OpenAI and from the Azure OpenAI service. OpenAI is a good choice for developers who want to leverage the raw power of the models themselves into another platform to build more sophisticated app architectures and begin to build multimodal genAI apps.

- **AWS's Amazon Titan will reach new heights but must do so quickly.** With Amazon Titan, Amazon Web Services (AWS) was late to the foundation model party. Thus, Titan models have not seen as significant adoption among customers as some of its competitors' models. That will change as AWS continues to iterate the Titan models and especially as its vast existing customer base will have easy access to the Titan family of models and all other models in AWS's Amazon Bedrock model service. However, AWS has not articulated a clear vision about when customers should choose to use Titan models versus other models available in Bedrock such as Anthropic's Claude. AWS's strategy for Titan appears to be taking a page from the cloud services playbook — offer its own models while enabling any and all comers to also offer models within Amazon Bedrock.

  AWS has strong capabilities in many of the surrounding support tools that its Bedrock service provides, such as model alignment, governance and security, and application development. Amazon's AI-FML offering is lacking in Titan's core capabilities for natural language understanding and generation, context window length, and code generation. If AWS wishes its models to continue to be a significant player in this space, it will need to focus on improving the Titan family of models. AWS customers appreciate that they can stay within the AWS cloud

© 2024 Forrester Research, Inc. All trademarks are property of their respective owners.
For more information, see the Citation Policy, contact citations@forrester.com, or call +1 866-367-7378.

environment to experiment not only with Titan models but with other models in Bedrock. Amazon's AI-FML offering will be appealing to AWS customers for its marketplace approach, rather than for the core Titan models themselves. Amazon declined to participate in the full Forrester Wave evaluation process.

- **Microsoft's Phi models are small and mighty but overshadowed by OpenAI.** Microsoft's AI is most prominently associated with its partnership with and investment in OpenAI. However, this is only part of Microsoft's strategy — the company's Phi family of models take a significantly different approach to pretraining. The Phi models leverage large amounts of synthetically generated content in addition to real content, which allows training with a smaller dataset that in theory can be more tightly curated. Microsoft is also deeply invested in building out tooling to enable technical and non-technical users to work on aligning models to business use cases for its customers. While the AI-FML ecosystem is crisscrossed with many different vendor partnerships and investments, Microsoft's investment in and partnership with OpenAI stands out as unique specifically because of its exclusivity — Microsoft is almost able to act as an AI-FML provider of OpenAI's core models as well as its own.

  Microsoft's Phi models are less capable than many of the others in this market, but its small size and tightly curated training dataset is a core value proposition for enterprises looking to deploy in constrained computing environments or that want a model with tightly focused behavior. Microsoft's Azure AI services surrounding the Phi family, as well as many other models, provide strong capabilities for aligning model behavior to enterprise needs. However, the Phi models are significantly behind in the scope of their training corpus, core model language capabilities, and context windows. Microsoft's AI-FML offering is a good fit for enterprises that have sufficient data gravity with Microsoft to align the models to their needs. Microsoft declined to participate in the full Forrester Wave evaluation process.

Contenders

- **Anthropic's Constitutional AI is appealing but needs tooling for ratification.** Anthropic has carved its unique place in the AI-FML market by introducing the concept of "Constitutional AI" as a guiding principle for aligning models to enterprise needs. Anthropic hopes to continue to be a leading voice in defining the shape of cutting-edge foundation models and is making a big bet on the importance of ever-larger and more complex models. While this strategy will doubtless continue to increase the power of Anthropic's Claude family of models,

© 2024 Forrester Research, Inc. All trademarks are property of their respective owners.
For more information, see the Citation Policy, contact citations@forrester.com, or call +1 866-367-7378.

it remains to be seen whether there is enough differentiation in the market to sustain the high cost of hyper-premium AI-FMLs.

Anthropic has very strong language capabilities in its core model, with one of the longest context windows currently on the market. While Anthropic has done significant work to align its model family to its Constitutional AI approach during pretraining, the company needs to offer more significant capabilities for enterprises to build applications and manage models within them. Today, enterprises leveraging Anthropic largely rely on third-party services or AI/ML platforms to support integrating the models into applications. Anthropic is a good fit for enterprises that want to work on advanced knowledge retrieval and research use cases requiring massive context windows. Anthropic declined to participate in the full Forrester Wave evaluation process.

- **Cohere aims to make business-friendly models, but its toolkit is lacking.** Cohere's strategy is to provide Command R+ as a premium model but also emphasize support for the data pipelines needed for RAG-based knowledge retrieval architectures. This approach will appeal to enterprises that want to build these types of applications but aren't equipped to build the supporting embedding creation and retrieval mechanisms. Cohere must expand its partner ecosystem and invest in enterprise governance tooling that goes beyond API calls.

  Cohere's Command models have strengths in core model capabilities for language and reasoning, as well as having some of the most notable multilingual capabilities with pretraining data from a variety of languages, including specific optimizations to perform well in some of the most common business languages. Cohere's models also offer some of the longer context windows available, enabling their models to address a wider range of enterprise use cases. Cohere has work to do to catch up in its application development and model management tools, as well as developing its multimodal capabilities. Cohere is a good choice for customers who want an AI-FML vendor that can give them strong support for RAG and other knowledge-retrieval use cases. Cohere declined to participate in the full Forrester Wave evaluation process.

Challengers

- **Mistral AI makes cool models, but it must invest fast in accoutrements to compete.** Mistral has made a name for itself over the past year by offering open-weight models that make strong appearances in model performance leaderboards, allowing it to punch above its weight in the market; however, the

© 2024 Forrester Research, Inc. All trademarks are property of their respective owners.
For more information, see the Citation Policy, contact citations@forrester.com, or call +1 866-367-7378.

company must quickly add sales, marketing, platform tooling development, and partner operations to compete with the growing number of players in this market and with other open-weight models. Mistral's roadmap takes its cues from customer requests and needs but lacks a cohesive and coherent approach on how it will address the needs of enterprise users.

Mistral models have strong core language capabilities. The models use a mixture of experts (MoE) approach, which enables them to achieve higher accuracy while using fewer computing resources at inference time compared to some other model architectures. Mistral has a lot of catching up to do in multiple areas to remain competitive, particularly capabilities for governance and security, application development, model management, and reliance and scalability. Mistral did not provide reference customers for this evaluation. Mistral is a good fit for companies who want to balance the advantages of open-weight models with the assurances of working with the provider that trained those models.

Evaluation Overview

We grouped our evaluation criteria into three high-level categories:

- **Current offering.** Each vendor's position on the vertical axis of the Forrester Wave graphic indicates the strength of its current offering.
- **Strategy.** Placement on the horizontal axis indicates the strength of the vendors' strategies, including elements such as vision and innovation.
- **Market presence.** The size of each vendor's marker on the graphic reflects Forrester's assessment of its market presence.

Vendor Inclusion Criteria

Each of the vendors we included in this assessment has:

- **A comprehensive, differentiated AI-FML.** The vendors included in the evaluation offer a AI-FML model that it principally trains and maintains.
- **An AI-FML as identified by Forrester.** Vendors included in this evaluation offer an AI-FML solution as defined above and as represented in the Landscape report on this market.
- **Active market participation.** Each vendor offers a solution that is actively marketed as an AI-FML solution and participates in the market by competing directly with other AI-FML solution vendors.

© 2024 Forrester Research, Inc. All trademarks are property of their respective owners.
For more information, see the Citation Policy, contact citations@forrester.com, or call +1 866-367-7378.

- **Strong Forrester client mindshare.** Only vendors that have significant mindshare and interest among Forrester's end-user clients are included.
- **Customers in production.** Included vendors have enterprise customers that have rolled out their AI-FML offering in full production.

Supplemental Material

Online Resource

We publish all our Forrester Wave scores and weightings in an Excel file that provides detailed product evaluations and customizable rankings; download this tool by clicking the link at the beginning of this report on Forrester.com. We intend these scores and default weightings to serve only as a starting point and encourage readers to adapt the weightings to fit their individual needs.

The Forrester Wave Methodology

A Forrester Wave is a guide for buyers considering their purchasing options in a technology marketplace. To offer an equitable process for all participants, Forrester follows The Forrester Wave™ Methodology to evaluate participating vendors.

In our review, we conduct primary research to develop a list of vendors to consider for the evaluation. From that initial pool of vendors, we narrow our final list based on the inclusion criteria. We then gather details of product and strategy through a detailed questionnaire, demos/briefings, and customer reference surveys/interviews. We use those inputs, along with the analyst's experience and expertise in the marketplace, to score vendors, using a relative rating system that compares each vendor against the others in the evaluation.

We include the Forrester Wave publishing date (quarter and year) clearly in the title of each Forrester Wave report. We evaluated the vendors participating in this Forrester Wave using materials they provided to us by April 30, 2024, and did not allow additional information after that point. We encourage readers to evaluate how the market and vendor offerings change over time.

In accordance with our vendor review policy, Forrester asks vendors to review our findings prior to publishing to check for accuracy. Vendors marked as nonparticipating vendors in the Forrester Wave graphic met our defined inclusion criteria but declined to participate in or contributed only partially to the evaluation. We score these vendors in accordance with our vendor participation policy and publish their positioning along with those of the participating vendors.
